

Reading data from Excel

from [unsatfit](https://unsatfit.github.io/unsatfit/excel.html) document: <https://unsatfit.github.io/unsatfit/excel.html>

This page explains how to load data from an Excel workbook.

In the [sample codes](#), WRF data is read from CSV file as:

```
ht = pd.read_csv('swrc.csv')
```

To read from an Excel worksheet instead:

1. Install openpyxl library by `python -m pip install openpyxl`.
2. Add:

```
import openpyxl
```

in the code.

1. Replace the CSV read with:

```
ht = pd.read_excel('data.xlsx', sheet_name='swrc')
```

1. Use [this sample Excel file \(Gilat loam\)](#).

This reads the WRF data from swrc worksheet in the file.

To read HCC data, replace:

```
hk = pd.read_csv('hcc.csv')
```

with:

```
hk = pd.read_excel('data.xlsx', sheet_name='hcc')
```

For more information, see [pandas.read_excel](#).
