

Install unsatfit

from [unsatfit](#) document: <https://sekika.github.io/unsatfit/install.html>

[Install Python 3](#). Mac and Linux distributions may include an outdated version of Python (Python 2), but you should install an updated one (Python 3). You can check your installed version of Python by `python -V`.

Install unsatfit library for Python 3 with [pip](#) by

```
python -m pip install unsatfit
```

or to specify Python 3

```
python3 -m pip install unsatfit
```

Now you can use unsatfit library in your Python code. [Sample code](#) is available.

[APT repository](#) is available for installing on Debian system.

1. Version control

- Latest release can be checked by [release history](#).
- Installed version can be checked by `python -m pip show unsatfit`
- Upgrade unsatfit by `python -m pip install --upgrade unsatfit`
