

Reference

from [unsatfit](https://sekika.github.io/unsatfit/reference.html) document: <https://sekika.github.io/unsatfit/reference.html>

It is all about Fit class of unsatfit.

1.Methods

1.1.For optimization

1.2.For figures

1.3.Pore-size distribution

See the [source comments](#) for detail. From version 5.4.

1.4.HYDRUS and PEST

See [HYDRUS](#), [PEST](#) and [source comments](#) for detail. From version 6.2.

1.5.Others

2.Properties for settings

- For boundary conditions, see [source](#).
- For least square optimization, see [source](#).
- For figure options, see [source](#).

For specifying font in figures, [FontProperties](#) object can be set as self.fp. For example, set font_path as the absolute path to a font file and

```
import unsatfit
from matplotlib.font_manager import FontProperties
f = unsatfit.Fit()
f.fp = FontProperties(fname=font_path, size=9)
```

It can be used for using [Japanese font](#).

3.Properties for return values of optimize()

4.AI documentation
