

SWRC Fit and hystfit

from [unsatfit](#) document: <https://sekika.github.io/unsatfit/swrcfit.html>

1. SWRC Fit

SWRC Fit is a web interface which uses [unsatfit](#) and determines parameters for water retention function. As it is easy to use, it has been [used in many papers](#). Source code is in the [repository](#).

- [SWRC Fit](#)

You can run SWRC Fit locally on your machine by using [Docker](#), which might be useful when the server is down or you have unstable network connection. Follow the [instructions here](#).

[GNU Octave version of SWRC Fit](#) is no longer maintained but the code is available.

2. hystfit

[hystfit](#) is a Python library for calculating hysteresis in water retention curve. It is implemented as a subclass of [unsatfit](#).

3. UNSODA viewer

The [UNSODA viewer](#) displays data from [UNSODA 2.0](#), the Unsaturated Soil Hydraulic Database by the U.S. Salinity Laboratory. For each dataset, you can fit water retention data with SWRC Fit via links labeled “Fit with various water retention models.” This is particularly useful for educational purposes.
